DETAILED ACTION

Drawings

1. The drawings were received on 29 September 2004. These drawings are approved.

Response to Amendment

2. In response to the amendment filed 29 September 2004, the following has occurred: The objections to the drawings, the specification, and the claims have been withdrawn by the examiner due to the changes made by the applicant.

Claim Objections

3. Claim 1 is objected to because of the following informalities: There should be a semi-colon after the limitation "an optocoupler having a collector phototransistor output". There should be a semicolon after the limitation "phototransistor output at low frequency". Appropriate correction is required.

Claim Rejections - 35 USC § 102

4. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(a) the invention was known or used by others in this country, or patented or described in a printed publication in this or a foreign country, before the invention thereof by the applicant for a patent.

5. Claims 1 and 2 are rejected under 35 U.S.C. 102(a) as being anticipated by applicant's admitted prior art.

Claim 1: an optocoupler drive circuit controlling current for driving a high side of a totem pole pair in a bridge circuit for commutating a motor comprising an optocoupler having a collector phototransistor output (Fig. 6: optocoupler), an upper power transistor in the totem pole (Fig. 6: Q1, Q2) having a gate input (Fig. 6: base of Q1) connected to the collector phototransistor output (Fig. 6: collector of optocoupler phototransistor connected to base of Q1), the upper power transistor (Fig. 6: Q1) being directly driven by the collector phototransistor output at low frequency (Fig. 6: Q1 is driven by q4 which is driven by the collector phototransistor, therefore Q1 is driven by the collector phototransistor), and means for controlling a drive current to said upper power transistor gate input to reduce its speed of turn on (Fig. 6: the resistor below the +15V).

Claim 2: the means for controlling the drive current is a resistor (Fig. 6: the resistor below the +15V) in series with the upper power transistor gate input (Fig. 6: Q1).

Response to Arguments

6. Applicant's arguments with respect to claims 1 and 2 have been considered but are moot in view of the new ground(s) of rejection.

Conclusion

7. Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP

Art Unit: 2837

§ 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.
